

## A new generation

Imagine that you arrive to a new world. Imagine that everything you see is new to you. You may have some ideas on what you want and what you are able to or may quickly learn.

First of all you are curious, and then some alien creatures are coming towards you. You might be a little uncomfortable, but at the same time you are drawn by curiosity to look at the strangers.

It must be some of the reflections that puzzle the brain of this chick of the wheatear. We meet the chick out in the Greenlandic wilderness. Perhaps we are the first human beings the bird experience.

The wheatear is very common in the Greenlandic landscape. The wheatear mainly feed on insects caught in the air and on the ground, and the berries and part of plants. The wheatear is known by the bend and twist of the tail. Therefore, in Greenlandic the bird is called the kussak, which means 'which bows'.
